Try these short programs to get some firsthand experience with Python's lists. You might want to create a new folder for each chapter's exercises to keep them organized.

- **3-1. Names:** Store the names of a few of your friends in a list called names. Print each person's name by accessing each element in the list, one at a time.
- **3-2. Greetings:** Start with the list you used in Exercise 3-1, but instead of just printing each person's name, print a message to them. The text of each message should be the same, but each message should be personalized with the person's name.
- **3-3. Your Own List:** Think of your favorite mode of transportation, such as a motorcycle or a car, and make a list that stores several examples. Use your list to print a series of statements about these items, such as "I would like to own a Honda motorcycle."

The following exercises are a bit more complex than those in Chapter 2, but they give you an opportunity to use lists in all of the ways described.

- **3-4. Guest List:** If you could invite anyone, living or deceased, to dinner, who would you invite? Make a list that includes at least three people you'd like to invite to dinner. Then use your list to print a message to each person, inviting them to dinner.
- **3-5. Changing Guest List:** You just heard that one of your guests can't make the dinner, so you need to send out a new set of invitations. You'll have to think of someone else to invite.
- Start with your program from Exercise 3-4. Add a print statement at the end of your program stating the name of the guest who can't make it.
- Modify your list, replacing the name of the guest who can't make it with the name of the new person you are inviting.
- Print a second set of invitation messages, one for each person who is still in your list.
- **3-6. More Guests:** You just found a bigger dinner table, so now more space is available. Think of three more guests to invite to dinner.
- Start with your program from Exercise 3-4 or Exercise 3-5. Add a print statement to the end of your program informing people that you found a bigger dinner table.
- Use insert() to add one new guest to the beginning of your list.
- Use insert() to add one new guest to the middle of your list.
- Use append() to add one new guest to the end of your list.
- Print a new set of invitation messages, one for each person in your list.
- 3-7. Shrinking Guest List: You just found out that your new dinner table won't arrive in time for the dinner, and you have space for only two guests.
- Start with your program from Exercise 3-6. Add a new line that prints a
  message saying that you can invite only two people for dinner.
- Use pop() to remove guests from your list one at a time until only two
  names remain in your list. Each time you pop a name from your list, print
  a message to that person letting them know you're sorry you can't invite
  them to dinner.
- Print a message to each of the two people still on your list, letting them know they're still invited.
- Use del to remove the last two names from your list, so you have an empty list. Print your list to make sure you actually have an empty list at the end of your program.

3-8. Seeing the World: Think of at least five places in the world you'd like to visit.

- Store the locations in a list. Make sure the list is not in alphabetical order.
- Print your list in its original order. Don't worry about printing the list neatly, just print it as a raw Python list.
- Use sorted() to print your list in alphabetical order without modifying the
  actual list.
- Show that your list is still in its original order by printing it.
- Use sorted() to print your list in reverse alphabetical order without changing the order of the original list.
- Show that your list is still in its original order by printing it again.
- Use reverse() to change the order of your list. Print the list to show that its
  order has changed.
- Use reverse() to change the order of your list again. Print the list to show it's back to its original order.
- Use sort() to change your list so it's stored in alphabetical order. Print the
  list to show that its order has been changed.
- Use sort() to change your list so it's stored in reverse alphabetical order.
   Print the list to show that its order has changed.
- **3-9. Dinner Guests:** Working with one of the programs from Exercises 3-4 through 3-7 (page 46), use len() to print a message indicating the number of people you are inviting to dinner.
- **3-10. Every Function:** Think of something you could store in a list. For example, you could make a list of mountains, rivers, countries, cities, languages, or anything else you'd like. Write a program that creates a list containing these items and then uses each function introduced in this chapter at least once.

- **4-1. Pizzas:** Think of at least three kinds of your favorite pizza. Store these pizza names in a list, and then use a for loop to print the name of each pizza.
- Modify your for loop to print a sentence using the name of the pizza
  instead of printing just the name of the pizza. For each pizza you should
  have one line of output containing a simple statement like I like pepperoni
  pizza.
- Add a line at the end of your program, outside the for loop, that states
  how much you like pizza. The output should consist of three or more lines
  about the kinds of pizza you like and then an additional sentence, such as
  I really love pizza!
- **4-2. Animals:** Think of at least three different animals that have a common characteristic. Store the names of these animals in a list, and then use a for loop to print out the name of each animal.
- Modify your program to print a statement about each animal, such as A dog would make a great pet.
- Add a line at the end of your program stating what these animals have in common. You could print a sentence such as Any of these animals would make a great pet!

**5-1. Conditional Tests:** Write a series of conditional tests. Print a statement describing each test and your prediction for the results of each test. Your code should look something like this:

```
car = 'subaru'
print("Is car == 'subaru'? I predict True.")
print(car == 'subaru')

print("\nIs car == 'audi'? I predict False.")
print(car == 'audi')
```

- Look closely at your results, and make sure you understand why each line evaluates to True or False.
- Create at least 10 tests. Have at least 5 tests evaluate to True and another 5 tests evaluate to False.
- **5-2. More Conditional Tests:** You don't have to limit the number of tests you create to 10. If you want to try more comparisons, write more tests and add them to *conditional\_tests.py*. Have at least one True and one False result for each of the following:
- Tests for equality and inequality with strings
- Tests using the lower() function
- Numerical tests involving equality and inequality, greater than and less than, greater than or equal to, and less than or equal to
- Tests using the and keyword and the or keyword
- Test whether an item is in a list
- Test whether an item is not in a list

- **5-3. Alien Colors #1:** Imagine an alien was just shot down in a game. Create a variable called alien color and assign it a value of 'green', 'yellow', or 'red'.
- Write an if statement to test whether the alien's color is green. If it is, print
  a message that the player just earned 5 points.
- Write one version of this program that passes the if test and another that fails. (The version that fails will have no output.)
- **5-4. Alien Colors #2:** Choose a color for an alien as you did in Exercise 5-3, and write an if-else chain.
- If the alien's color is green, print a statement that the player just earned
   5 points for shooting the alien.
- If the alien's color isn't green, print a statement that the player just earned 10 points.
- Write one version of this program that runs the if block and another that runs the else block.

- **5-5. Alien Colors #3:** Turn your if-else chain from Exercise 5-4 into an if-elif-else chain.
- If the alien is green, print a message that the player earned 5 points.
- If the alien is yellow, print a message that the player earned 10 points.
- If the alien is red, print a message that the player earned 15 points.
- Write three versions of this program, making sure each message is printed for the appropriate color alien.
- **5-6. Stages of Life:** Write an if-elif-else chain that determines a person's stage of life. Set a value for the variable age, and then:
- If the person is less than 2 years old, print a message that the person is a baby.
- If the person is at least 2 years old but less than 4, print a message that the person is a toddler.
- If the person is at least 4 years old but less than 13, print a message that the person is a kid.
- If the person is at least 13 years old but less than 20, print a message that the person is a teenager.
- If the person is at least 20 years old but less than 65, print a message that the person is an adult.
- If the person is age 65 or older, print a message that the person is an elder.
- **5-7. Favorite Fruit:** Make a list of your favorite fruits, and then write a series of independent if statements that check for certain fruits in your list.
- Make a list of your three favorite fruits and call it favorite\_fruits.
- Write five if statements. Each should check whether a certain kind of fruit is in your list. If the fruit is in your list, the if block should print a statement, such as You really like bananas!
